OPEN AGENT HACKATHON 2026 · TRACK 02 · LEITNER LABS

Proofline.

An agent that answers high-stakes questions with a verifiable evidence trail. Every claim links back to the exact rows it came from.

THE PROBLEM

Agents answer confidently. They cite vaguely.

- "Switch suppliers" — **says who, from what data, when?**
- High-stakes decisions need proof, not prose
- Today the evidence is a log file nobody reads

THE CONTRACT

A claim ships only with evidence.

claim → evidence rows → source → query lineage → retrieval time

- Unverifiable claims **never ship** — filtered before the answer is composed
- Every citation is **clickable** in the UI and printable in the CLI

THE DEMO

"Should we switch our oat-milk supplier?"

- Meridian Roast Co. — 6 cafes, one decision, three fragmented sources
- **SQLite** purchase ledger + quality tests · **CSV** price lists + certifications · **web** recall notices
- Answer: 8 verified claims, 14 evidence refs, zero hand-waving

ARCHITECTURE

How it works.

```
question → decompose → federated queries (lineage-stamped)
        → extract claims → VERIFY (evidence or drop)
        → compose → remember (H-MEM episode + trust ledger)
```

SPONSOR TECHNOLOGY

Built on the stack.

- **Meterless H-MEM** — memory with provenance + audited trust ledger; conformance 13/13 in-repo
- **NVIDIA Nemotron** — composition and judging models (OpenAI-compatible endpoint)
- **Zetaris pattern** — query-in-place federation, lineage on every query; drops onto a live Zetaris endpoint by config

WHY IT WINS

Verifiability as the product.

- Impact: decisions people can defend (30)
- Technical: evidence-gated claims, audited memory (20)
- Innovation: explain-why as a first-class surface (15)

WHAT'S NEXT

From demo to daily driver.

- Point the federation layer at a live Zetaris endpoint — **config, not code**
- Race Nemotron models; let H-MEM dreaming propose risk hypotheses overnight
- Proofline — **an agent that can explain why.**
